

Business Analytics:

What we are trying to accomplish is to allow universities to create various groups for students to obtain information regarding events going on around campus (sports, events, notifications, etc.) Users (students) will be able to sign-up for the groups to receive notifications for upcoming events/reminders. This will also be a database for students who are not a part of any groups to find information on things going on around campus to get involved. We will keep the members of each group organized specifically within that group. Within each group, there will be an admin (group president/leader) who will be able to go in and create the notifications and manage the students in the group.

A database will be created for each organization that is available on campus. That database will contain the details for events and the dates in which they will occur. Another database for students will be created, identifying them by student id. The last database that will be created is a database for group presidents/leaders (which will have admin privileges to add/remove events, manage users apart of the groups, etc.)
